

field service

Wright-Dixon has highly skilled field service teams, capable to service most rotating turbo machinery on the customer's site.

Areas of focus vary from small to medium steam turbines, compressors and industrial diesel engines. The service work is backed by an in-house workshop that allows quick turnaround time and control over quality.

Work performed by Wright Dixon includes the servicing of old machines where spare parts are no longer available and re-engineering is required. Our years of experience in a wide range of machinery give us a unique ability to solve customer problems over a wide range of applications.

Our field service teams perform maintenance, relocation and installation of rotating machinery all over Southern Africa.
