

white metal bearings

Wright-Dixon realised the need to have a high quality white metal bearing facility available where it counts.

An in-house facility was started and quickly grew into a business in its own right. The specialised nature of our white metal bearing business allows us to provide a very competitive and high quality product.

Our bearing business is geared for a quick turnaround time and breakdown services form a large percentage of our business. Casting of white metal is done at controlled temperatures. Only virgin white metal of selected grades is utilised. These qualities and our stringent quality requirements allow us to provide a unique service to the South African industry.

Servicing of large turbo machinery, including steam turbines, pumps, compressors and other related units, allows us to provide an additional service to bearing manufacturing.
